## FLOW CONTROL VALVE LINEAR

## GAS

- Linear relationship between flow rate and opening angle
- For high control accuracy
- Directly mountable  
Flow Control Drives FCD
- Suitable for 100 % Hydrogen
- EU Certified

### Technical description

The DUNGS flow control valve linear FCVL... is a control valve without zero shut-off according to EN 13611.

The compact construction consists of flow rate bodies with mounting threaded flanges, which allow for simple assembly with the pipeline in front of the burner.

### Application

The DUNGS flow control valve linear FCVL... is used to control the gas supply to gas burners and gas appliances. The control valve is suitable for gases in gas families 1, 2 and 3, hydrogen (H<sub>2</sub>, dry) and other neutral gases.

### Certification

Examination certificate according to

- EU Gas Appliances Regulation
- UKCA Gas Appliances Regulation

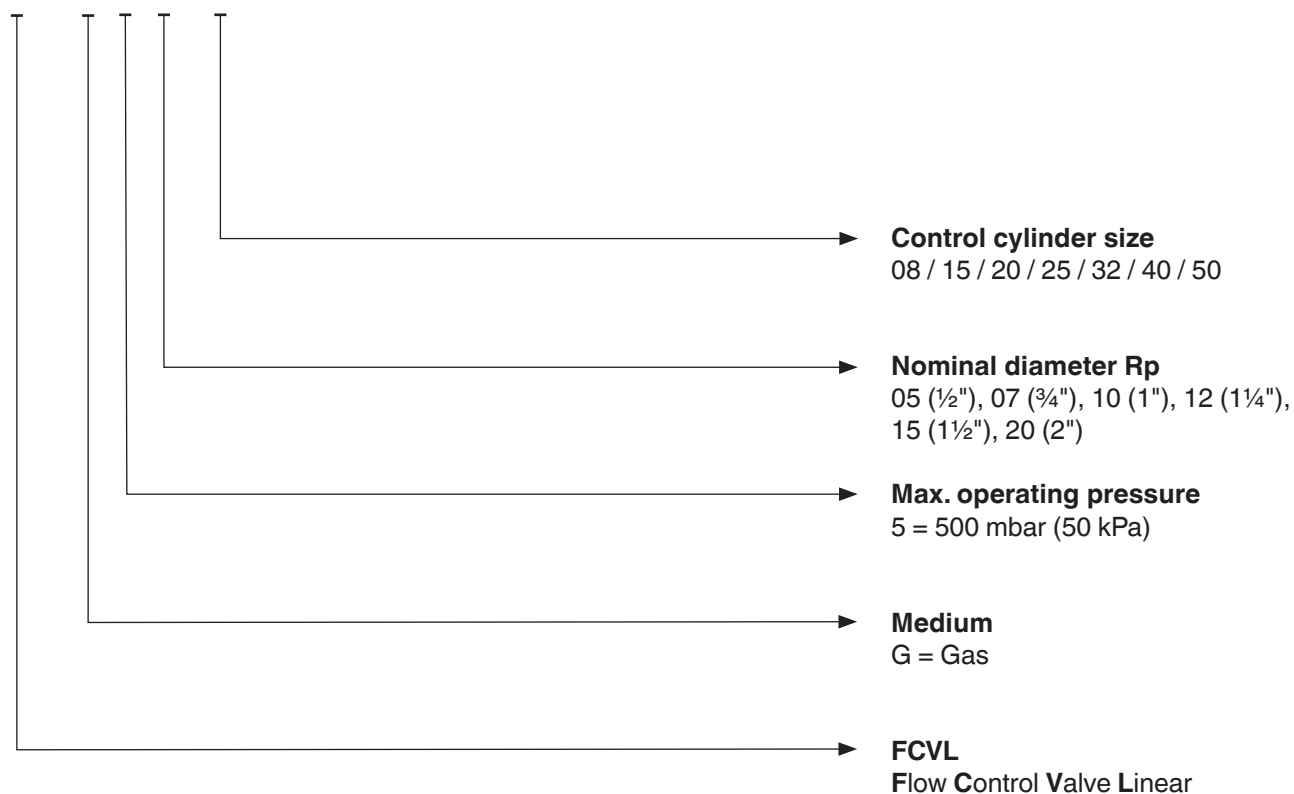

## Flow Control Valve Linear FCVL...

Technical data	
Nominal diameters	Rp ½ - Rp 2
Max. operating pressure	500 mbar (50 kPa)
Max. differential pressure	500 mbar
Medium	Gas families 1, 2 and 3, H <sub>2</sub> and other neutral gaseous media. Suitable for gases up to max. 0.1 vol. % H <sub>2</sub> S
Ambient temperature	-20 °C to +60 °C
Medium temperature	-20 °C to +60 °C
Max. permissible actuating speed	1.5 s / 90°
Materials of the gas-carrying parts	Housing: aluminium Spindle: stainless steel Control cylinder: aluminium Threaded flange: aluminium Seals: NBR
Installation position	Vertically upright to lying horizontally
Drive adoption	External square 7 x 7 mm More on request

## Type code FCV

**FCVL-G** **XY****Y**/**ZZ**

**For example: “FCVL-G 515/40”**

# Flow Control Valve Linear FCVL...

## Function

The flow control valve linear FCVL is used to adjust the gas supply volume to gas consumption devices and is an automatic control valve that is powered by auxiliary energy. The corresponding electromechanical actuator determines the position of the control cylinder and the operating time. The rotatable cylinders with an opening angle between 0° and 90° help to achieve high control accuracy and the desired flow rate. Different cross-section sizes for the medium are released depending on the opening angle and cylinder position. There is a linear relationship between flow rate and opening angle, which can be measured using an integrated position indicator. There are stops at approx. -5° and approx. 95°.

Depending on the model, the control cylinder is equipped with a different opening size so that it can maintain corresponding levels of flow rate. A lever is available as an accessory for manually adjusting the opening angle.

**Avoid direct contact between the linear control valve and dried masonry, concrete walls or floors!**

**Only set the nominal pressure on the pressure regulator. Any output-related restrictions should only be performed using the linear control valve.**

**Check for leaks and function after installation!**

## Device selection

The following values must be known for the dimensioning of the FCVL:

1. Max. flow rate  $V_{\max.}$
2. Pressure loss  $\Delta p$  at max. flow rate
3. Min. flow rate  $V_{\min.}$
4. Differential pressure when the control valve is in the closed position (= pu)

The control cylinder size can be determined either mathematically via the  $K_v$  value or using the flow diagram. Check whether the required minimum flow rate is reached when the cylinder is positioned at 0°.

If the calculated or measured value is below the required minimum flow rate, the cylinder can be used.

**If the volume flows are small, the pressure loss of upstream devices will fall. This increases the  $\Delta p$  available to the linear control valve.**

**To obtain an optimum control response, always choose the control cylinder size with the largest pressure loss  $\Delta p$  ( $\Delta p > 10$  mbar).**

## $K_v$ values for flow control valve linear FCVL

The flow control valve linear FCVL is limited by the following parameters:

### Max. operating pressure

500 mbar (50 kPa)

### Differential pressure

500 mbar

When the valve is used in subcritical flow states, the following applies:

$V_n$  [m³/h]

Flow rate, standard state

$\Delta p$  [bar]

Pressure loss FCVL

$p_2$  [bar]

Absolute pressure downstream of FCVL

$\rho_n$  [kg/m³]

Standard gas density

$T_1$  [K]

Absolute gas temperature upstream of FCVL

$K_v$  [m³/h]

Valve flow coefficient, value taken from the table below

$$V_n = 514 \cdot K_v \cdot \sqrt{\frac{\Delta p \cdot p_2}{\rho_n \cdot T_1}}$$

Type / control cylinder size	$K_v$ value for control cylinder position		Mounted inlet / outlet flange size
	0°	90°	
FCVL..08	0.4	4.3	1/2"
FCVL..15	0.4	7.5	3/4"
FCVL..20	0.4	14.0	1"
FCVL..25	0.4	19.1	1 1/4"
FCVL..32	0.5	35.6	1 1/2"
FCVL..40	0.5	72.3	2"
FCVL..50	0.5	119.6	2"
